

New solution in the world of labeling and emblem making

The UV Transfer technology, also known as UV DTF, offers a new solution in the world of labeling and branding, as the stickers made using this method can be applied to almost any hard-surfaced product.

The essence of UV Transfer technology is that the printing is done directly onto an adhesive film, in white, CMYK, and varnish layers. Afterward, the print goes through a laminator, where an application-assisting film is applied.

Quantity	Unit price
Minimum price (up to 0.5 m ²)	25 EUR
0.5 – 5 m ²	36 EUR / m²
More than 5 m ²	29 EUR / m²

**The above prices do not include the cost of the file preparation cost.
The file preparation cost is 1 EUR / graphic.**

How to apply the UV DTF stickers?

Cut – Clean the surface, peel the white side
Position and stick – Rub and peel the foil – Ready

How is it different from regular paper or vinyl stickers?

- The stickers can be used perfectly on dark-colored surfaces.
- No special pre-treatment of the surfaces to be labeled is required.
- No need for cutting or trimming.
- Designs can be created without backgrounds or enclosing frames, which resembles the quality of screen-printed designs.

Thanks to the varnish layer, the surface of the sticker is glossy and slightly raised, providing a very refined appearance.

Due to the advantages of UV Transfer technology and its ease of application, it offers a great option for labeling promotional items and advertising products.

Useful tips for crating the design

- Maximum print width: **58 cm**
- Please submit the files to be printed in **300 dpi** resolution, in **CMYK** color mode, **transparent background**, to **scale TIFF format**.
- You can arrange your designs to a sheet if you have a lot of different files and need the same quantity from each, because in this case you can save the file preparation costs.
